Key Definitions

In order to make sure that every member of the team is clear about the definitions that will be used, we have provided a list of key terms in the next few pages along with commonly used definitions for each term.

Additionally, we define both the process (also known “intermediate outcome”) measures as well as the clinically-relevant outcome measures we will be using to evaluate how our program is working.

These definitions were provided to us from the North Carolina Center for Hospital Quality and Patient Safety, Centers for Disease Control and Prevention (CDC), and from a toolkit used by the Michigan Health and Hospital Association written by Mohamad G. Fakih, MD, MPH, Sanjay Saint, MD, MPH, Sarah Krein, RN, PhD., and Russ Olmsted, MPH, CIC. We have modified the definitions and the material as appropriate.

Finally, we also provide recent material and definitions used by the CDC’s National Healthcare Safety Network (NHSN) as a reference source.
1. **Asymptomatic bacteriuria (a.k.a. ASB):** the presence of bacteria in the urine, which is not causing symptoms of a UTI. 75% to 90% of patients with ASB do not develop a systemic inflammatory response or other clinical manifestations suggesting infection. Treatment of ASB has not been shown to be clinically beneficial in most patient populations and is associated with development of multi-drug resistant organisms. Of note, the National Healthcare Safety Network (NHSN) removed the ASB definition from its UTI definitions in 2009.

2. **Biofilm:** communities of different types of microorganisms that attach to environmental surfaces, such as medical devices. They enclose themselves in a protective matrix that is highly protective, and are typically far more resistant to antibiotics than free-floating organisms. They develop rapidly and may be found on any surface where moisture and nutrients are present.

3. **Catheter-associated urinary tract infection (CAUTI):** as defined by the NHSN, is divided into two classifications: symptomatic CAUTI and asymptomatic, bacteremic urinary tract infection (bloodstream infection secondary to a UTI). For details, see the NHSN definitions section at the end of this section. Of note, definitions of CAUTI vary between studies, making the appraisal of evidence very difficult. Unfortunately, investigators have used many different definitions for CAUTI, and have often not distinguished between symptomatic CAUTI and asymptomatic bacteriuria.

4. **External catheter (a.k.a. condom catheter, Texas catheter.):** a urine containment device that fits over the external genitalia and is attached to a urinary drainage bag. Used in men.

5. **Indwelling urinary catheter:** drainage tube that is inserted aseptically into the urinary bladder through the urethra, is left in place, and is connected to a closed collection system. (Frequently called a “Foley catheter.”)
6. **Short-term catheterization:** generally considered to be a period of less than 30 days of having an indwelling urinary catheter.

7. **Straight catheterization (a.k.a. intermittent catheterization or in-and-out catheterization):** brief insertion (and removal) of a catheter into the bladder via the urethra to drain urine at different time intervals.

8. **Symptomatic UTI (SUTI):** patients with a positive urine culture and experiencing, NHSN-defined UTI signs or symptoms with no other recognized cause of the symptoms.

**Process measures:**

1. **Utilization ratio** = Number of patients with a urinary catheter on the unit / Total number of patients on the unit

2. **Prevalence rate** = (Number of patients with a urinary catheter on the unit / Total number of patients on the unit) x 100

3. **Rate of unnecessary urinary catheter use** = (Days of unnecessary urinary catheters / Total number of patient days) x 1000

4. **Unnecessary urinary catheter %** = (Days of unnecessary urinary catheters / Total number of days of urinary catheters used) x 100

5. **Discontinuation rate of unnecessary urinary catheter %** = (Number of unnecessary urinary catheters discontinued / All urinary catheters without valid indications) x 100

**Outcome Measures**

1. **Symptomatic CAUTI rate** = (Number of symptomatic CAUTIs / number of urinary catheter days) x 1000

2. **Symptomatic CAUTI rate (using patient days)** = (Number of symptomatic CAUTIs / Number of patient days) x 10,000

Downloaded from www.catheterout.org
3. Bloodstream infection related to CAUTI* (NHSN rate) = (Number of bloodstream-related infections due to CAUTI/number of urinary catheter days) x 1000

* Established rates used by the CDC’s National Healthcare Safety Network

The next several pages come from the CDC and provide additional definitions.
Catheter-Associated Urinary Tract Infection (CAUTI) Event

**Introduction:** The urinary tract is the most common site of healthcare-associated infection, accounting for more than 30% of infections reported by acute care hospitals\(^1\). Virtually all healthcare-associated urinary tract infections (UTIs) are caused by instrumentation of the urinary tract.

CAUTI can lead to such complications as cystitis, pyelonephritis, gram-negative bacteremia, prostatitis, epididymitis, and orchitis in males and, less commonly, endocarditis, vertebral osteomyelitis, septic arthritis, endophthalmitis, and meningitis in all patients. Complications associated with CAUTI cause discomfort to the patient, prolonged hospital stay, and increased cost and mortality. Each year, more than 13,000 deaths are associated with UTIs.\(^1\)

Prevention of CAUTIs is discussed in the CDC/HICPAC document, *Guideline for Prevention of Catheter-associated Urinary Tract Infections*\(^2\).

**Settings:** Surveillance will occur in any of three types of inpatient locations: (1) ICUs, (2) SCAs (includes hematology/oncology wards, bone marrow transplant units, solid organ transplant units, inpatient dialysis units, long term acute care areas), and (3) any other inpatient location in the institution where denominator data can be collected (e.g., surgical wards).

NOTE: It is not required to monitor for CAUTIs after the patient is discharged from the facility, however, if discovered, they should be reported to NHSN. No additional indwelling catheter days are reported.

**Requirements:** Surveillance for CAUTI is performed in at least one inpatient location in the healthcare institution for at least one calendar month as indicated in the *Patient Safety Monthly Reporting Plan* (CDC 57.106).

**Definitions:** Urinary tract infections (UTI) are defined using symptomatic urinary tract infection (SUTI) criteria or Asymptomatic Bacteremic UTI (ABUTI) criteria (Table 1 and Figure 1). Report UTIs that are catheter-associated (i.e. patient had an indwelling urinary catheter at the time of or within 48 hours before onset of the event). NOTE: There is no minimum period of time that the catheter must be in place in order for the UTI to be considered catheter-associated. NOTE: SUTI 1b and 2b and other UTI (OUTI) cannot be catheter-associated.

EXAMPLE: Patient has a Foley catheter in place on an inpatient unit. It is discontinued, and 4 days later patient meets the criteria for a UTI. This is not reported as a CAUTI because the time since Foley discontinuation exceeds 48 hours.
Location of attribution: The location where the patient was assigned on the date of the UTI event, which is further defined as the date when the first clinical evidence appeared or the date the specimen use to meet the criterion was collected, whichever came first. EXAMPLE: Patient has a Foley catheter inserted in the Emergency Department and then is admitted to the MICU. Within 24 hours of admission to the MICU, patient meets criteria for UTI. This is reported to the NHSN as a CAUTI for the MICU, because the Emergency Department is not an inpatient location and no denominator data are collected there.

EXAMPLE: Patient on the urology ward of Hospital A had the Foley catheter removed and is discharged home a few hours later. The ICP from Hospital B calls the next day to report that this patient has been admitted to Hospital B with a UTI. This CAUTI should be reported to NHSN for Hospital A and attributed to the urology ward.

EXCEPTION: If a CAUTI develops within 48 hours of transfer from one inpatient location to another in the same facility, the infection is attributed to the transferring location. This is called the Transfer Rule and examples are shown below.

- Patient with a Foley catheter in place in the SICU is transferred to the surgical ward. Thirty six (36) hours later, the patient meets the criteria for UTI. This is reported to NHSN as a CAUTI for the SICU.
- Patient is transferred to the medical ward from the MSICU after having the Foley catheter removed. Within 24 hours, patient meets criteria for a UTI. This is reported to NHSN as a CAUTI for the MSICU.
- Patient with a Foley catheter in place is transferred from the medical ward to the coronary care ICU (CCU). After 4 days in the CCU, the patient meets the criteria for UTI. This is reported to NHSN as a CAUTI for the CCU.

Indwelling catheter: a drainage tube that is inserted into the urinary bladder through the urethra, is left in place, and is connected to a closed collection system; also called a Foley catheter; does not include straight in-and-out catheters.

Numerator Data: The Urinary Tract Infection (UTI) Form (CDC 57.114) is used to collect and report each CAUTI that is identified during the month selected for surveillance. The Instructions for Completion of Urinary Tract Infection Form (Tables of Instructions, Tables 5 and 2a) includes brief instructions for collection and entry of each data element on the form. The UTI form includes patient demographic information and information on whether or not an indwelling urinary catheter was present. Additional data include the specific criteria met for identifying the UTI, whether the patient developed a secondary bloodstream infection, whether the patient died, and the organisms isolated from cultures and their antimicrobial susceptibilities.

Denominator Data: Device days and patient days are used for denominators (See Chapter 16 Key Terms). Indwelling urinary catheter days, which are the number of patients with an indwelling urinary catheter device, are collected daily, at the same time each day, according to the chosen location using the appropriate form (CDC 57.116,
These daily counts are summed and only the total for the month is entered into NHSN. Indwelling urinary catheter days and patient days are collected separately for each of the locations monitored.

**Data Analyses:** The CAUTI rate per 1000 urinary catheter days is calculated by dividing the number of CAUTIs by the number of catheter days and multiplying the result by 1000. The Urinary Catheter Utilization Ratio is calculated by dividing the number of urinary catheter days by the number of patient days. These calculations will be performed separately for the different types of ICUs, specialty care areas, and other locations in the institution, except for neonatal locations.

<td></td>
</tr>
</tbody>
</table>

Criterion Asymptomatic Bacteremic Urinary Tract Infection (ABUTI)

Patient with or without an indwelling urinary catheter has no signs or symptoms (i.e., no fever (>38°C) for patients ≤65 years of age*; and for any age patient no urgency, frequency, dysuria, suprapubic tenderness, or costovertebral angle pain or tenderness, OR for a patient ≤1 year of age, no fever (>38°C core), hypothermia (<36°C core), apnea, bradycardia, dysuria, lethargy, or vomiting) and a positive urine culture of ≥10⁵ CFU/ml with no more than 2 species of uropathogen microorganisms** and a positive blood culture with at least 1 matching uropathogen microorganism to the urine culture.

*Fever is not diagnostic for UTI in the elderly (>65 years of age) and therefore fever in this age group does not disqualify from meeting the criteria of an ABUTI.

**Uropathogen microorganisms are: Gram-negative bacilli, *Staphylococcus* spp., yeasts, betahemolytic *Streptococcus* spp., *Enterococcus* spp., *G. vaginalis*, *Aerococcus urinae*, and *Corynebacterium* (urease positive).

Comments

- Urinary catheter tips should not be cultured and are not acceptable for the diagnosis of a urinary tract infection.
- Urine cultures must be obtained using appropriate technique, such as clean catch collection or
**Table 1-Urinary Tract Infection Criteria**

catheterization. Specimens from indwelling catheters should be aspirated through the disinfected sampling ports.

- In infants, urine cultures should be obtained by bladder catheterization or suprapubic aspiration; positive urine cultures from bag specimens are unreliable and should be confirmed by specimens aseptically obtained by catheterization or suprapubic aspiration.

- Urine specimens for culture should be processed as soon as possible, preferably within 1 to 2 hours. If urine specimens cannot be processed within 30 minutes of collection, they should be refrigerated, or inoculated into primary isolation medium before transport, or transported in an appropriate urine preservative. Refrigerated specimens should be cultured within 24 hours.

- Urine specimen labels should indicate whether or not the patient is symptomatic.

- Report secondary bloodstream infection = “Yes” for all cases of Asymptomatic Bacteremic Urinary Tract Infection (ABUTI).

- Report *Corynebacterium* (urease positive) as either *Corynebacterium species unspecified* (COS) or, as *C. urealyticum* (CORUR) if so speciated.

**Comment**

- Report infections following circumcision in newborns as SST-CIRC.
Identification and Categorization of SUTI Indwelling Catheter Discontinued in Prior 48 Hours

Figure

Patient had an indwelling urinary catheter at the time of specimen collection

At least 1 of the following with no other recognized cause:
- fever (>38°C)
- suprapubic tenderness
- costovertebral angle pain or tenderness

OR

A positive urinalysis demonstrated by at least 1 of the following findings:
- positive dipstick for leukocyte esterase and/or nitrite
- pyuria (urine specimen with ≥10 WBC/mm³ or ≥3 WBC/high power field of unspun urine)
- microorganisms seen on Gram stain of unspun urine

A positive urine culture of ≥10⁵ CFU/ml with no more than 2 species of microorganisms

A positive urine culture of ≥10³ and <10⁵ CFU/ml with no more than 2 species of microorganisms

SUTI – Criterion 1a

SUTI – Criterion 2a

CAUTI

CAUTI
Identification and Categorization of SUTI Indwelling Catheter Discontinued in Prior 48 Hours

Patient had an indwelling urinary catheter discontinued within 48 hours prior to specimen collection

At least 1 of the following with no other recognized cause:
- fever (>38°C)
- dysuria
- urgency
- suprapubic tenderness
- frequency
- costovertebral angle pain or tenderness

OR

A positive urinalysis demonstrated by at least 1 of the following findings:
- positive dipstick for leukocyte esterase and/or nitrite
- pyuria (urine specimen with ≥10 WBC/mm³ or ≥3 WBC/high power field of unspun urine)
- microorganisms seen on Gram stain of unspun urine

A positive urine culture of ≥10⁵ CFU/ml with no more than 2 species of microorganisms

A positive urine culture of ≥10³ and <10⁵ CFU/ml with no more than 2 species of microorganisms

SUTI – Criterion 1a

CAUTI

SUTI – Criterion 2a

CAUTI
Identification and Categorization of SUTI Without Indwelling Catheter at Time of or Within 48 Hours Prior to Specimen Collection

**Figure 3.**

**Patient did not have an indwelling urinary catheter at the time of specimen collection nor within 48 hours prior to specimen collection**

**Signs and Symptoms**

At least 1 of the following with no other recognized cause:
- fever (>38°C) in a patient ≤65 years of age (fever is not part of criteria for those >65 years of age)
- urgency
- frequency
- dysuria
- suprapubic tenderness
- costovertebral angle pain or tenderness

**Urinalysis Culture Evidence**

A positive urinalysis demonstrated by at least 1 of the following findings:
- positive dipstick for leukocyte esterase and/or nitrite
- pyuria (urine specimen with ≥10 WBC/mm³ or ≥3 WBC/high power field of unspun urine)
- microorganisms seen on Gram stain of unspun urine

A positive urine culture of ≥10⁵ CFU/ml with no more than 2 species of microorganisms

A positive urine culture of ≥10³ and <10⁵ CFU/ml with no more than 2 species of microorganisms

**SUTI – Criterion 1b**

**SUTI – Criterion 2b**
Identification and Categorization of SUTI in Patient ≤1 Year of Age

**Patient ≤1 year of age (with or without an indwelling urinary catheter)**

- At least 1 of the following with no other recognized cause:
  - □ fever (>38°C core)
  - □ hypothermia (<36°C core)
  - □ apnea
  - □ bradycardia
  - □ dysuria
  - □ lethargy
  - □ vomiting

**Signs and Symptoms**

- OR

**Urinalysis**

- A positive urinalysis demonstrated by at least 1 of the following findings:
  - □ positive dipstick for leukocyte esterase and/or nitrite
  - □ pyuria (urine specimen with ≥10 WBC/mm³ or ≥3 WBC/high power field of unspun urine)
  - □ microorganisms seen on Gram stain of unspun urine

**Culture Evidence**

- A positive urine culture of ≥10⁵ CFU/ml with no more than 2 species of microorganisms
- A positive urine culture of ≥10³ and <10⁵ CFU/ml with no more than 2 species of microorganisms

**SUTI – Criterion 3**

- Was an indwelling urinary catheter in place within the last 48 hours?
  - Yes: CAUTI
  - No: SUTI

**SUTI – Criterion 4**

- Was an indwelling urinary catheter in place within the last 48 hours?
  - Yes: CAUTI
  - No: SUTI
Identification of Asymptomatic Bacteremic Urinary Tract Infection (ABUTI)

**Figure 5.**

**Patient with or without an indwelling catheter**

**Signs and Symptoms**

Patient of any age:
- NONE of the following:
  - urgency
  - frequency
  - dysuria
  - suprapubic pain
  - costovertebral angle pain or tenderness
  Nor: fever >38°C if patient ≤65 years of age

Patient ≤1 year of age:
- NONE of the following:
  - fever (>38°C core)
  - hypothermia (<36°C core)
  - apnea
  - bradycardia
  - dysuria
  - lethargy
  - vomiting

**Culture Evidence**

A positive urine culture of ≥10⁵ CFU/ml with no more than 2 species of uropathogen microorganisms*

A positive blood culture with at least 1 matching uropathogen microorganism* to the urine culture

**Asymptomatic Bacteremic Urinary Tract Infection (ABUTI)**

---

*Uropathogen microorganisms are: Gram-negative bacilli, *Staphylococcus* spp., yeasts, beta-hemolytic *Streptococcus* spp., *Enterococcus* spp., *G. vaginalis*, *Aerococcus urinae*, *Corynebacterium* (urease positive)†.

†Report *Corynebacterium* (urease positive) as either *Corynebacterium species unspecified* (COS) or, as *C. urealyticum* (CORUR) if so speciated.
